"In this balanced and lucid treatment of the 'evolution' of modern Catholic attitudes towards science, O'Leary ranges across papal encyclicals, theological pronouncements, and scientific essays. He has drawn on current scholarship on science and religion and its rejection of simple master narratives to present a nuanced study of the controversies within the Catholic world as well as between Catholics and unbelievers." —Bernard Lightman, Professor of Humanities, York University, Toronto, and editor of *Isis*

"With this book we now possess a map of Catholic responses to science from the time of Darwin's *Origin of Species* to the present... Slowly, the dark, repressive clouds of the late nineteenth century have given way to a thoughtful, restrained attitude to science that seeks to mediate—sometimes more successfully than others—between tradition and scientific innovation. O'Leary has traced the many twists and turns in this story with clarity and insight." —Geoffrey Cantor, School of Philosophy, University of Leeds
